Project Title: Weather data analysis and forecasting for the different regions in Uganda.

Problem statement: collect weather data from  [weatherapi](#) and [openweathermap](#) for different regions in Uganda, store it in a database of your choice, and analyse weather patterns using python.

The goal is to derive insights into temperature trends, rainfall patterns, and other weather variables across different regions. These insights can help users make informed decisions for weather- sensitive activities, such as agriculture, tourism, and outdoor events.

Let's do this,
